

Integrated Security Corporation announces the WX-2020 weather station, the newest enhancement to its Infinity 2020 perimeter intrusion detection system.

The WX-2020 will on display at ISC West in Las Vegas March 28-30th in our booth 11128. (see [link to free registration at the top of this page](#))

We have totally updated the weather station to include an innovative optical rain sensor to give more precise rain measurements. Precipitation falls through a light band between the arms of the sensor, induced by diodes, leading to a shadowing effect on the receiving side. Along with the anemometer that is gauging wind speed, the two instruments together provide even better detection and real-time compensation during extreme weather conditions.

This real-time data gives the Infinity 2020 system superior performance when the potential for false alarms are at their highest and improving on our already low false alarm rate.
